

callimachus

A FAMILY CATALOGUE FOR EVERYTHING YOU SAVE

See a film you want to watch, tap once, and it's waiting in the family library on every phone when you sit down to watch.

PART ONE · FOR THE FAMILY · PART TWO · UNDER THE HOOD

We save things everywhere, and then they vanish.

SAVED ON

Instagram

Posts, reels, and named collections.

SAVED ON

The New York Times

The family's shared Saved list.

SAVED IN

Chrome

Folders called Watch, Read, Listen.

SENT TO

Yourself

A texted link, a tab left open for a week.

None of them can answer: "what's a good film for an eight-year-old that we can stream tonight?"

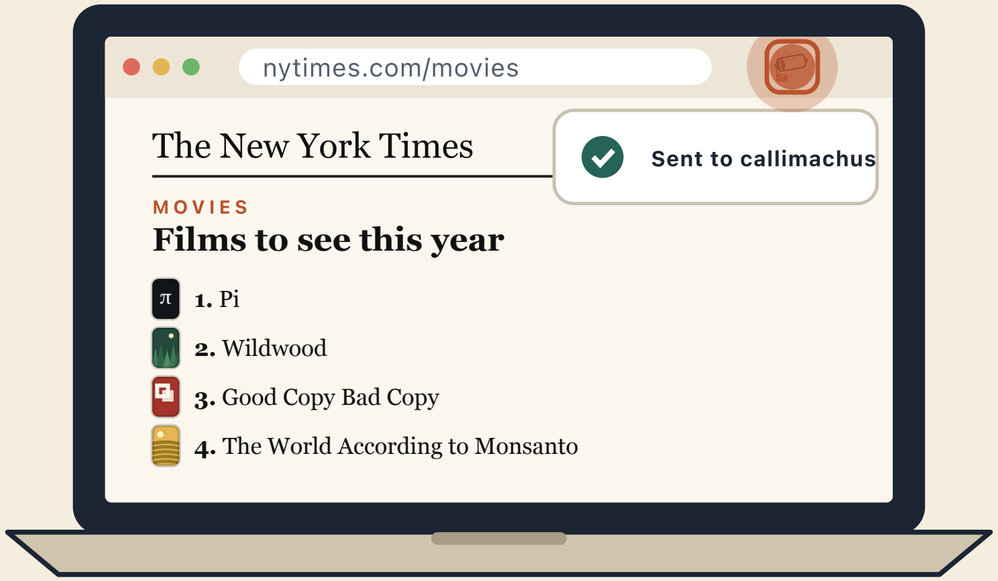

SAW IT? TAP IT.

No typing. No app to open.

Scroll Instagram, see a trailer of a film you want to see, tap.

Share, then *Save to callimachus*.

A list of films you want to see in the Times? Tap.

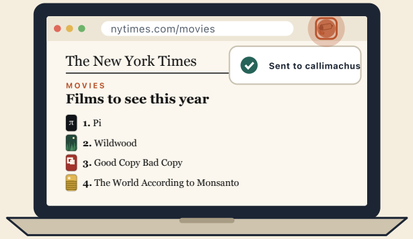

One click on the callimachus button, and every film on the list is filed. Old bookmarks and Instagram saves are found for you every morning.

Save it anywhere. Watch it together.

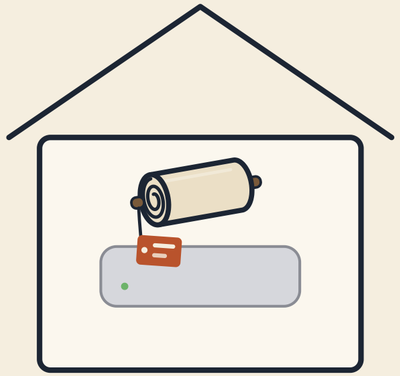

Your phone

Share, Save

Your laptop

A list in the Times, the button in Chrome

callimachus engine

At home: works out what it is, finds where to watch

callimachus library

A page per film, on every phone and laptop

Movie night

Pick one. Press play.

A library to browse, *not a list to scroll.*

Watch tonight on what we pay for

Who's watching? only what suits the room

My list seen it · I wanna see it · wait for me

Very highly rated IMDb 8+ or RT 90%

Pick who's on the couch. *The library does the rest.*

The whole family
what suits all five; G only if very highly rated

With our 10-year-old
what suits the youngest, by Common Sense's scores

Parents and the older boys
what suits our 13-year-old

John and Karina alone
what our eldest said no to or is too explicit for him, and very highly rated R

Horror night, not Karina
horror, and what Karina said no to

Every film shows which of our services it's on. About 200 films for each group tonight.

WHERE TO WATCH IT

One tap from the page to the film.

FILMS AND SERIES

On what you pay for

Your own services first, then free, then rent or buy.

VIDEOS

Straight to it

The video itself, or a saved copy if it has gone.

ARTICLES

The page, kept

And a saved copy, for when it moves.

ART

See it or buy it

The artist's shop, gallery or profile.

Every page also links out to IMDb, Rotten Tomatoes, Letterboxd, Wikipedia and Common Sense Media.

Save from all of them. *Open it on all of them.*

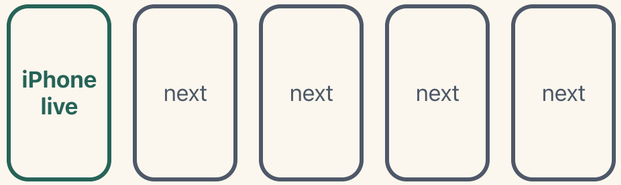

Any phone or laptop
saves it

→

callimachus, at home
files it for you

→

Every phone and laptop
opens the same library

A film saved on the bus is in the library by the time you're home, and a tick on one phone shows on everyone's. Karina's iPhone was first, on 27 October; the rest of the family is next.

RIGHT FOR WHOEVER'S ON THE COUCH

The kids' phones get the kids' library.

AGES

What suits the room

Common Sense Media's age, and its sex and violence scores, decide what a group can watch.

POSTERS

Nothing explicit, ever

Every poster is checked at home before it reaches a phone.

RULES

The family decides

Views only hide things; nothing anyone saved is ever deleted.

And if it guessed the wrong film, pick the right one: the same page is fixed in place.

Nothing made up. *Stored at home.*

- Every rating and age comes from a public source, and says which.
- If no source knows, the space stays blank rather than guessed.
- Nothing anyone saved is ever thrown away.
- The library is stored on the family's own computers and phones, and nothing is sold.
- When the free model at home can't work out a save, Anthropic's Claude is asked about it, and Claude agents step in when something breaks.
- Karina's account is never read by a script.

MOVIE NIGHT

Pick something everyone can watch. *Press play.*

Everything you saved, from every app, in one place, ready when you are.

PART TWO

Under the hood.

How it works, for the curious: every step a save goes through, the AI it uses only when it must, the agents that fix it, and how it keeps the family's data at home.

WHAT IT IS

Find every save. Name it. Look it up. *File one note.*

FINDS

Wherever it was saved

Sent from a browser or a phone's Share menu, or read from Instagram, Chrome bookmark folders, exports and the inbox.

KNOWS

From public sources

What it is, from TMDb, OMDb, Wikidata, Common Sense Media and Open Library; and where to watch, read or hear it.

FILES

In your own vault, on every phone

One note per title in the family's callimachus vault, filed straight away and synced to every phone; you correct it, and it re-files.

Films, short films, series, online video, articles, books, podcasts, and now visual art; a list post files every entry, and a trilogy files every film.

SEND IT IN

One tap from wherever you are.

IN CHROME

Send to callimachus

A toolbar button, and a right-click on any page or link. It queues and retries; it never waits.

IN ANY BROWSER

A bookmarklet

Safari on the Mac and the iPhone too. It carries no password.

ON THE PHONE

Save to callimachus

In every app's Share menu, through a shared Reminders list: instant, even with no signal.

Each one ends at a small private intake on your own network, and the save is filed straight away. The places you already save (Chrome folders, Instagram, the inbox) are still read every morning.

WHAT HAPPENS TO A SAVE

Filed the moment it arrives. (And a backup run at 6:30 a.m.)

01
Capture
Read each source, newest first, to its checkpoint.

02
Ledger
Skip what was judged before. Never twice.

03
Classify
Media? Which title? Code first, then the local model.

04
Resolve
One canonical id: TMDb or Open Library.

05
Where to watch
A streaming service, the open web, or archive.org.

06
Enrich
Facts, registry links and the poster, from free sources.

07
Check images
A nudity filter at home. Library done; new saves soon.

08
File
At once, even a best guess.

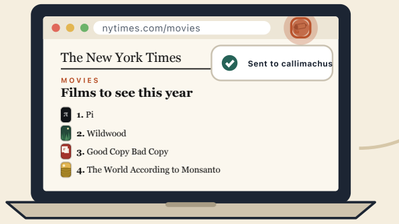

A healthy run is plain code plus a free model on the home network: no paid AI, no agent, nothing to approve.

You send it. *The engine fetches it.*

YOU FIND IT
on Instagram, in the Times, in Chrome

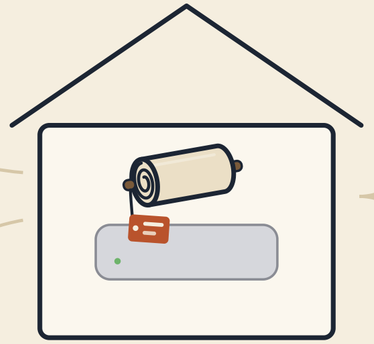

your phone
Share, Save to callimachus

your laptop
the callimachus button

AT HOME

callimachus engine
files each save it is sent,
and reads the places you save

ON THE WEB · THE SAVE ITSELF
the engine fetches what each link points to

Instagram
the post: its caption and its video

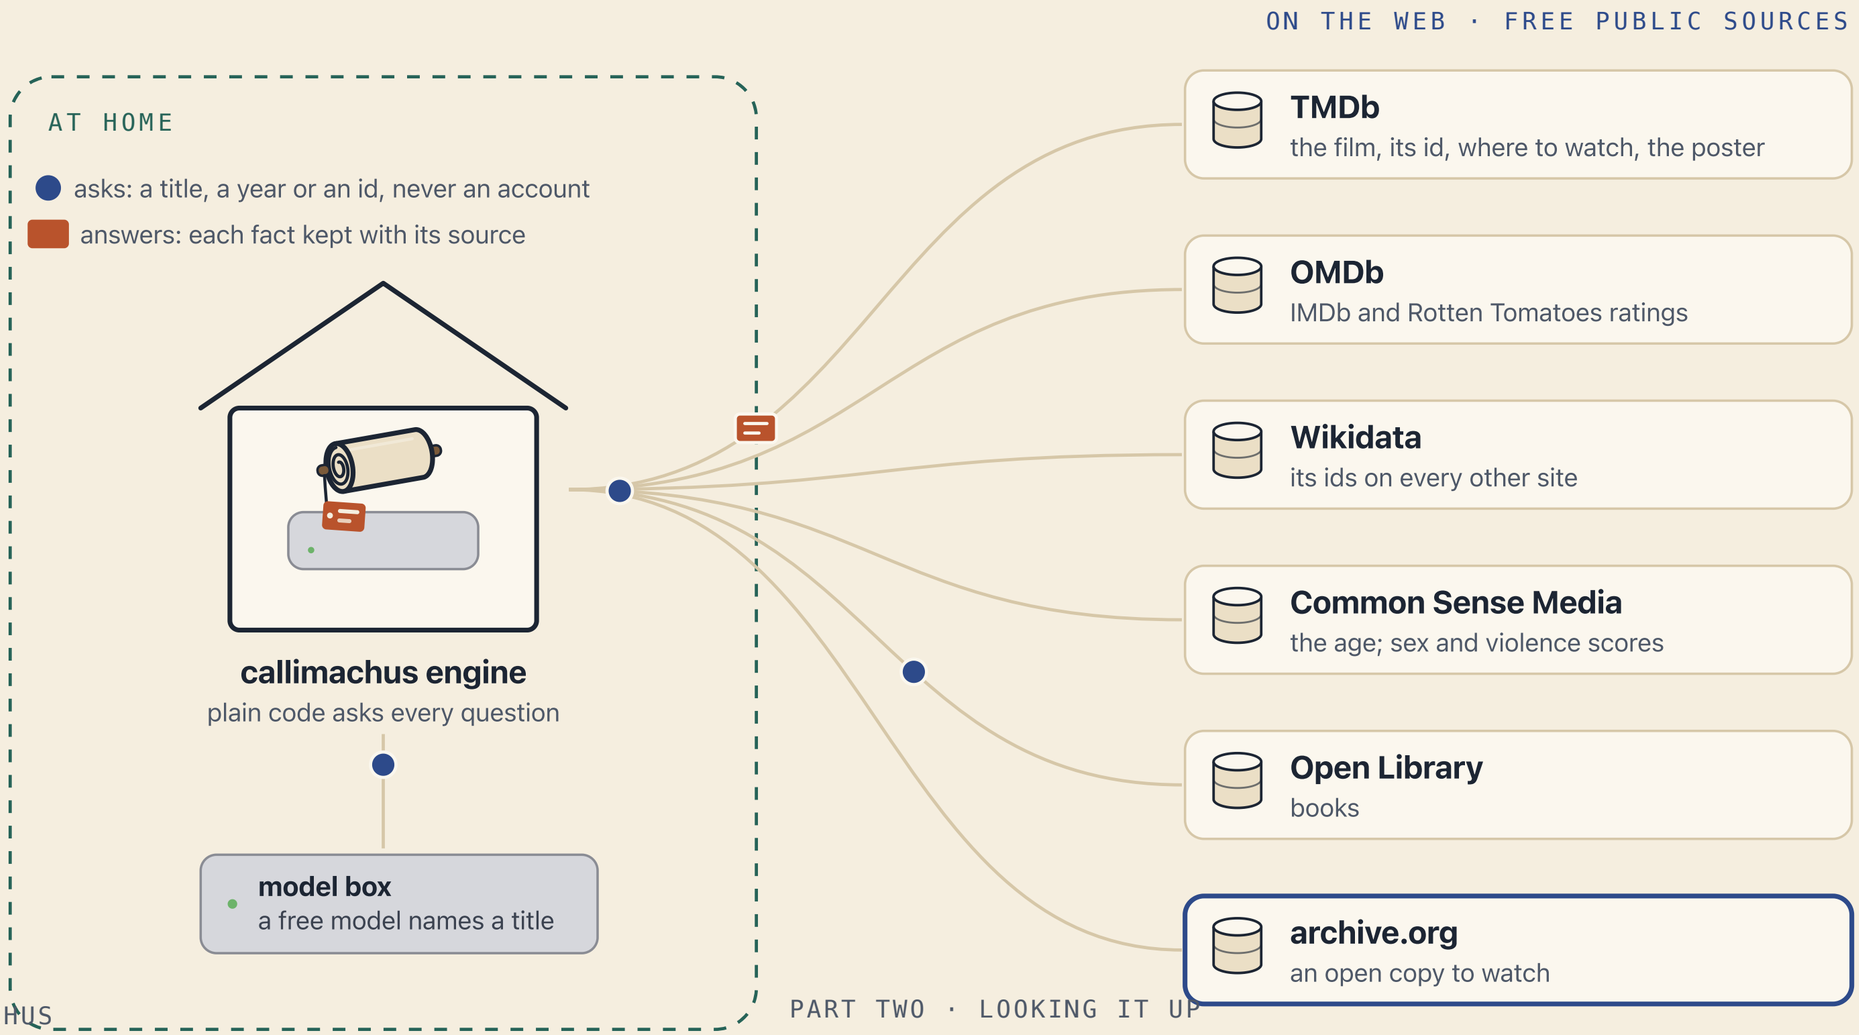

The New York Times
the article, and the saved list

Any web page
the page you saved

Wayback Machine
a saved copy, if the page moves

a link you sent · fetch it · the post or the article itself

The engine asks. *The sources answer.*

WHERE TO WATCH IT

One step from the note to the thing itself.

FILMS AND SERIES

Streaming, in order

Our services first, then other subscriptions, free, free with ads, rent or buy. (TMDb; data from JustWatch.)

ONLINE VIDEO

The page, or the archive

The page's own player, else a copy on archive.org.

ARTICLES

The page, kept

And the Wayback Machine's copy, for when it moves.

VISUAL ART

See it or buy it

The post, the artist's shop or gallery, the profile.

Code checks every match: title, length, maker or year. A copy it is not sure of is shown as *possible copy, not checked*, and never made the link.

FILED AT ONCE, CORRECTED BY A HUMAN JUDGE

Two questions on every card.

ONE

Is the record right?

The kind, the title, the catalogue entry. Approve it, pick candidate 1, 2 or 3, or say what it should be.

TWO

Can you watch, read or hear it in one step?

“Consumable by human quickly and easily”: a link that plays, or the list of where it streams.

A judge reads every card first and passes on only the unsure ones. A best guess is filed at once and marked a guess; your pick re-files the same note, never a second one.

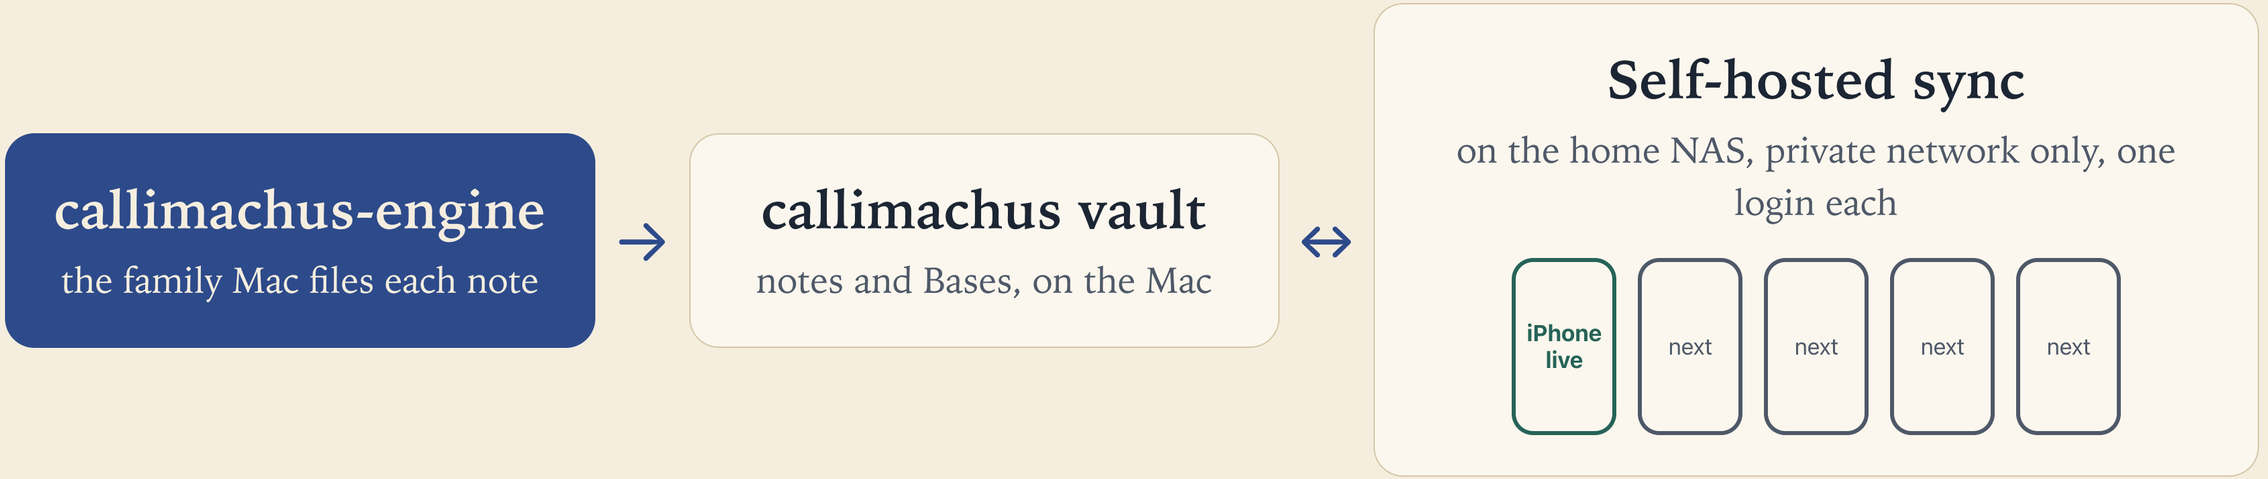

Two vaults, Bases, no plugins.

The family opens the **callimachus vault**; the work happens in a second one, **callimachus-engine**, that nobody needs to open. Obsidian's own Bases, no plugins: 9 Bases, 137 views, each named for exactly what it shows.

Everyone ticks *seen it*, *I wanna see it*, *wait for me*. *Very highly rated* always means IMDb 8+ or Rotten Tomatoes 90%+.

```
callimachus vault

│   ├── My checklist
│   └── Wait for me
└── Library/   one note per title
```

Two vaults and a self-hosted sync.

Obsidian LiveSync to a server on the family's own NAS: no cloud copy. Two-way, in seconds: a tick on a phone comes back to everyone. Karina's iPhone went live on 27 October with all 790 files; every other phone, iPad and Mac is next.

POSTERS, CHECKED FIRST

A cover on every card, and nothing explicit.

1 · FETCH

One poster

From TMDb, small enough for a phone, kept in the raw archive.

2 · EVERY POSTER

NudeNet

An open-source nudity detector, on the CPU at home. A label at 0.5 or above flags it.

3 · FLAGGED ONLY

A second look

One yes-or-no question to a vision model (qwen3-vl) on the home network.

4 · OR NEVER

Published

Only a clear *not explicit* reaches the vault. The rest stays in the archive.

All of it at home, no paid AI. The library's first run: 729 posters published, 2 flagged and both cleared, none blocked. New saves get theirs soon.

THE FIRST RULE

“Leave blanks blank. Do not ever make up data.”

Every field holds what a source gave, under that source's name, or what a person typed. Every value records where it was read from. Nothing is ever deleted.

```
# Pi (1998).md, as filed (excerpt)
title: Pi
year: 1998
csm_age: 16
tmdb_certification_us: R
omdb_imdb_rating: 7.3
omdb_rotten_tomatoes: 88
id_imdb: tt0138704
provenance:
  csm_age:
    fetch_record: ‹Common Sense page›
    pointer: jsonld:audience/
             suggestedMinAge
```

Reduce costs, and stay local when possible.

An item climbs only when the rung below could not finish it with confidence. Naming a title tops out at Sonnet; repairing the system at Opus. Never further.

Caps are counts, never dollars. Money is capped once, by a spend limit on a key used for nothing else.

6	**A person**	the Exceptions view
5	**Opus**	repair only
4	**Sonnet**	top rung for titles
3	**Haiku**	only if the local model is unsure
2	**Smarter local**	kept for later
1	**qwen3:30b, local**	always asked first
0	**Code**	rules, patterns, retries

HEALTHY, DEGRADED, STOPPED

Always one of three states, and a fuse.

Healthy

Every item finished by code or the free local model. The usual day.

Degraded

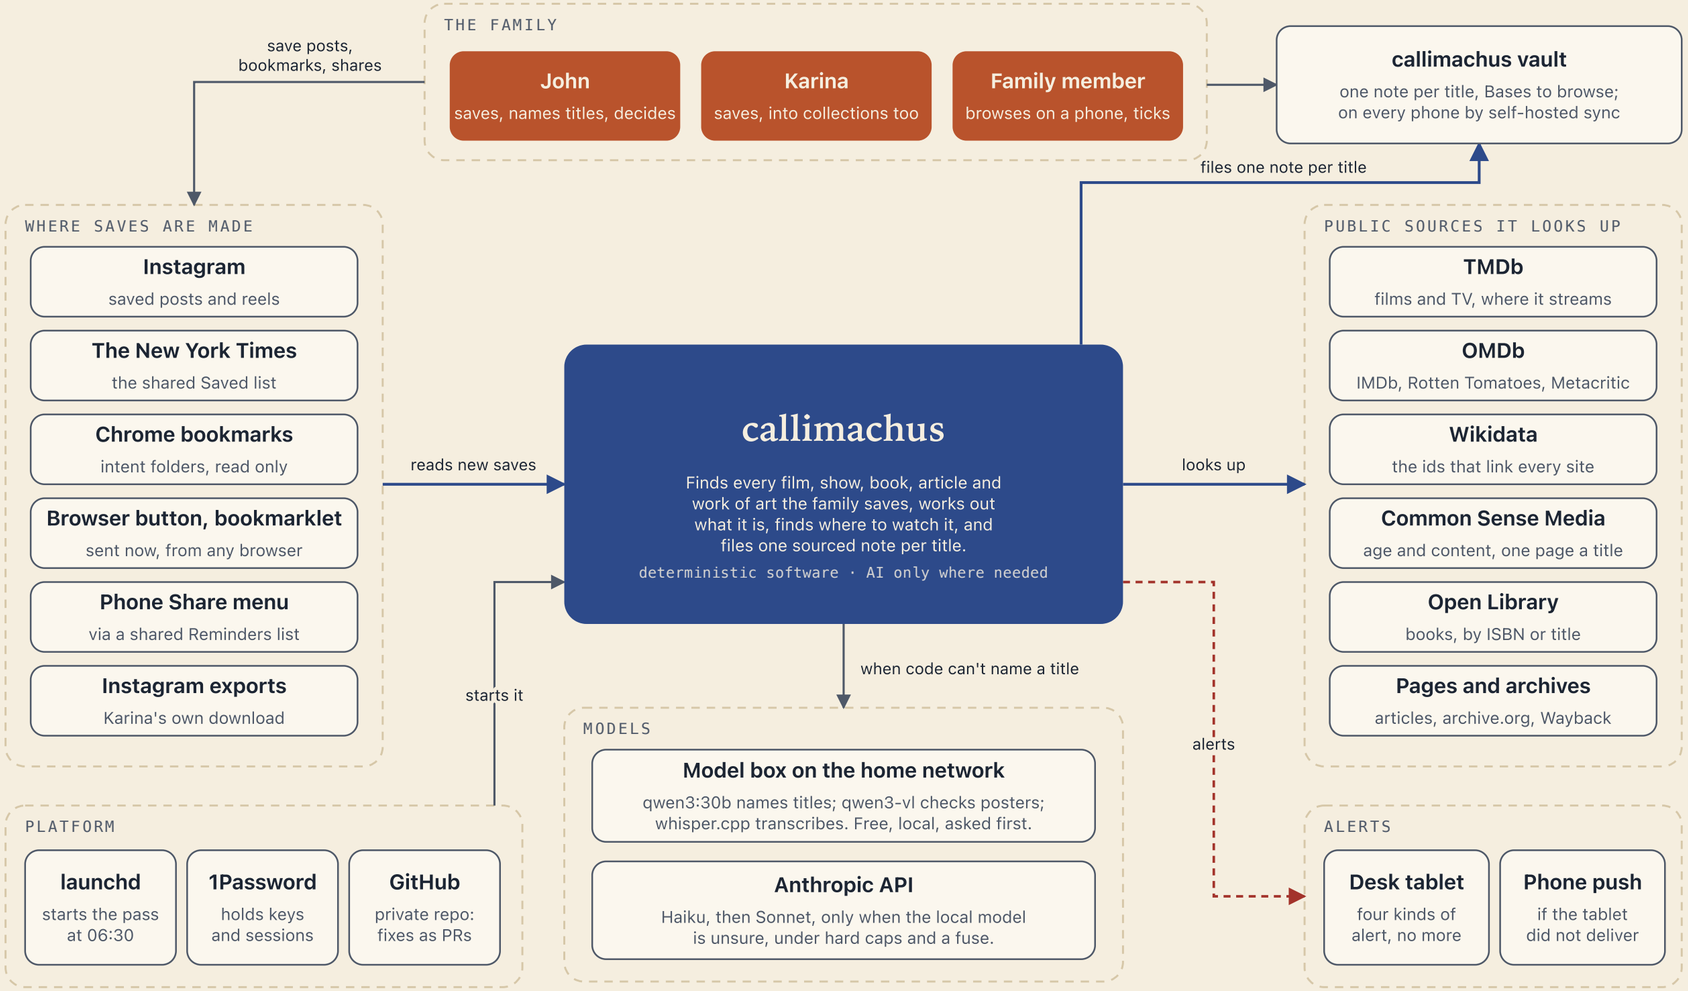

Correct notes, but something ran above plain code. An open signal drives a fix; 14 days at most.

Stopped

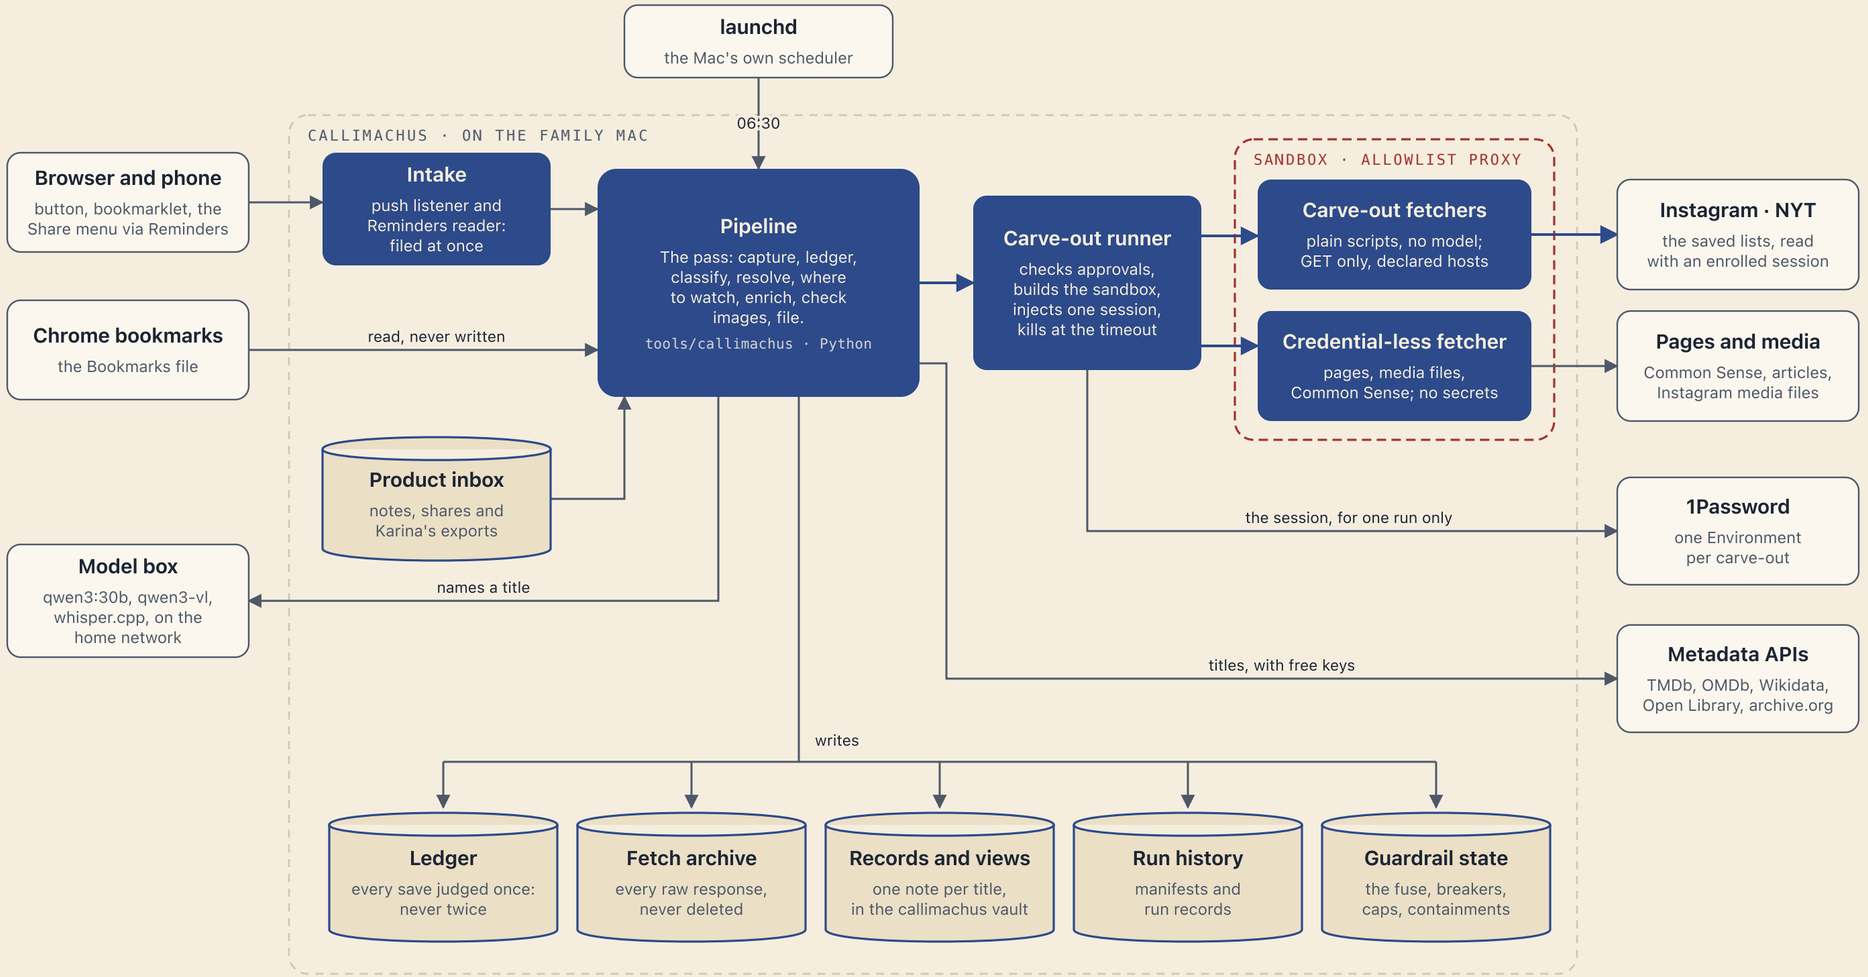

A capability is held. Capture keeps safely storing saves; the rest waits for a person.

The fuse blows on runaway numbers (more than 10 new fingerprints a day, 30 paid calls an hour, 5 agent sessions a day, any broken invariant or security trip) and stops every model call and agent launch until John resets it.

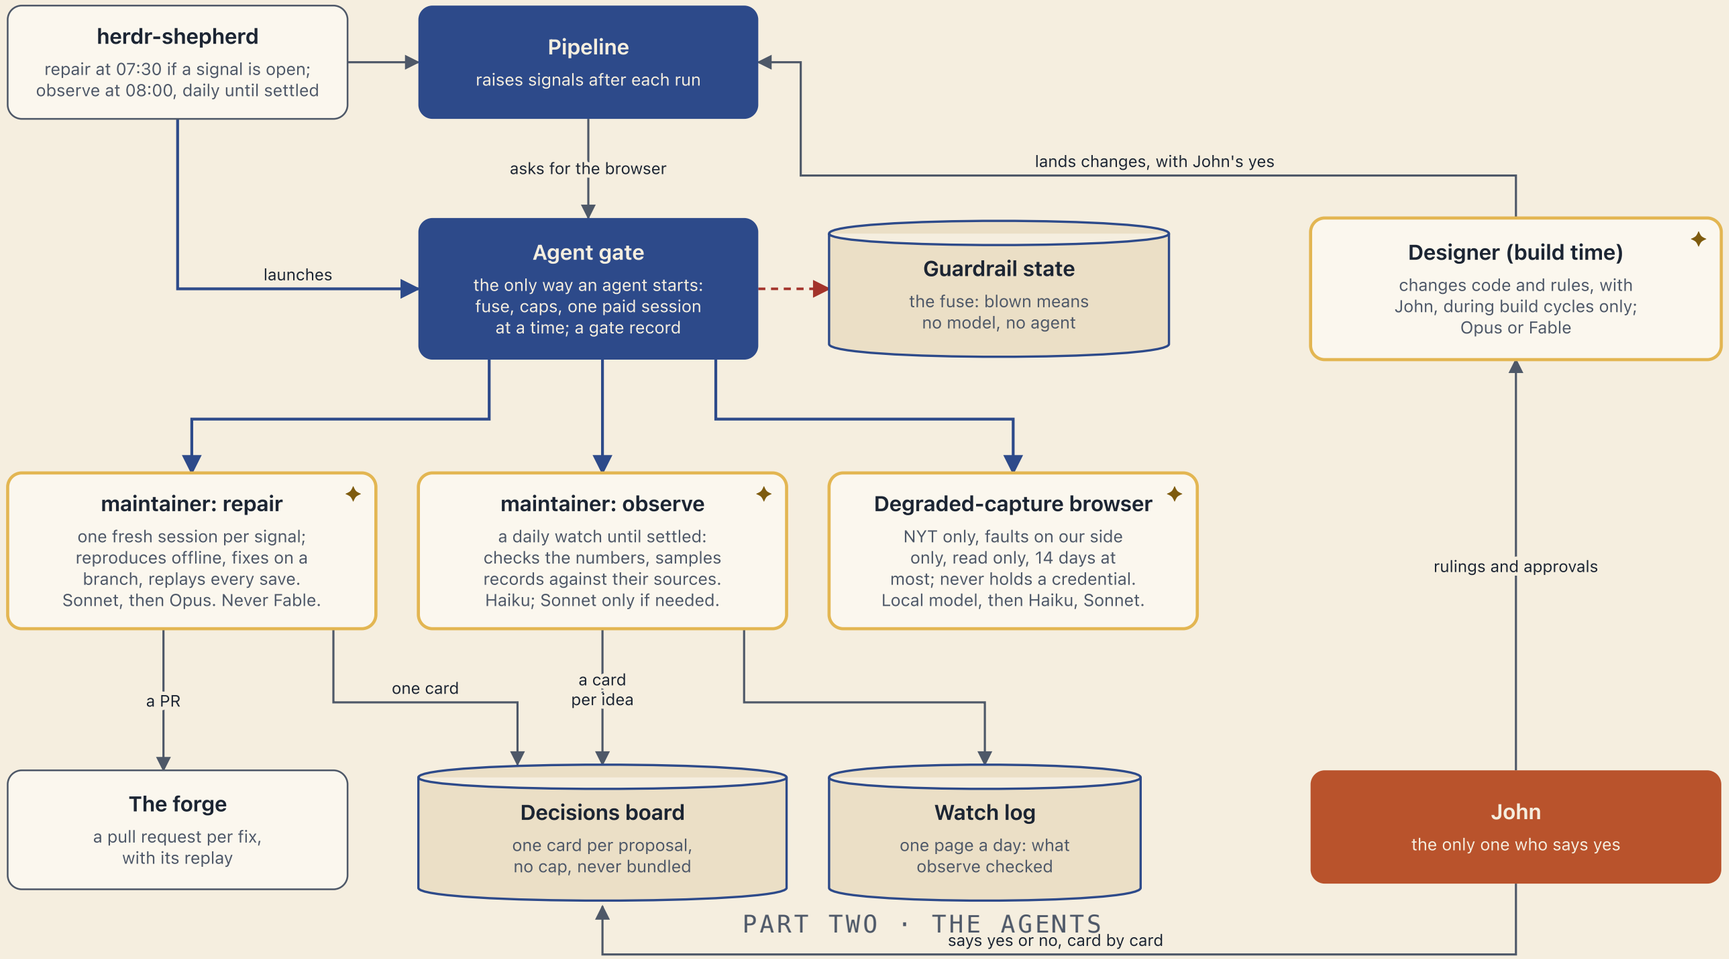

The system in its world.

Credentialed sign-ins are completely sandboxed.

Expensive architecture agents only when something breaks.

REPAIR AND OBSERVE

Two loops, and John says yes.

MAINTAINER: REPAIR · ON A SIGNAL

What broke, and how do we stop it?

A fresh session per signal: work around it today, reproduce it offline from the saved responses, fix it on a branch, replay every stored save, open one pull request and one card. Sonnet, then Opus. Never Fable.

MAINTAINER: OBSERVE · DAILY, UNTIL SETTLED

It works; how could it be better?

Recount the run, sample five notes against their sources, look for improvements under six headings, and propose each one as its own card. Haiku; Sonnet only if needed.

watchbill gives every agent a seat, a brief, a pinned model and a log. Every decision reaches John as its own card, with no cap.

Your saves are yours. They're stored at home.

- ✓ Saves are read from the family's own accounts by small, declared scripts in a sandbox.
- ✓ Everything filed stays in the family's own vault, on their own Mac and phones, synced by a server on their own NAS.
- ✓ Nothing is sold. Anthropic's Claude sees a save only while working on it: naming a title the local model could not, or an agent fixing a fault.
- ✓ Karina's account is never read by a script: her saves come from her own export, or she sends them.
- ✓ Sends arrive at one small door on the family's private network; it can only add a note to the inbox.

- – Public sources get a title or an id, never an account.
- – Paid AI sees a title question (the post's text, as data), never an account or session.
- – The code that holds a sign-in has no AI in it: injection there is impossible by construction.
- – GitHub holds the code and fixes, never the notes.
- – Posters are checked for nudity at home before any reaches a phone.

Released today, 28 October 2026.

TODAY · RELEASED

Real saves, real notes

Chrome button, bookmarklet and Share menu; where to watch, visual art, lists and sets; the callimachus vault and its Bases, with posters, registry links and Common Sense scores, live on Karina's iPhone.

COMING NEXT

Every device, every save

The image check for new saves, every family phone, iPad and laptop, the Chrome Web Store listing (unlisted), and the repair and observe loops.

LATER

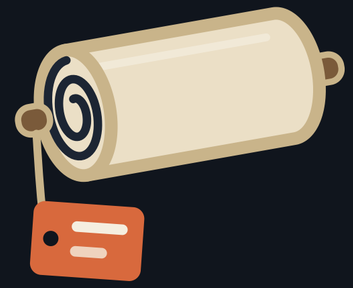

More kinds of media

Reddit saves, audiobooks, games; photos of a sign snapped on the street; a weekly digest.

Instagram comes on in careful steps: exports first, then a week on a throwaway test account, then one read a day.

Πίνακες

Callimachus of Cyrene catalogued the Library of Alexandria in the third century BC. His Pinakes was the first library catalogue. Each scroll carried a sillybos, a tag with its title. Every note callimachus files is one.

Made for Karina, who always wanted this to exist.

Happy birthday.
